How to Train DSPAM

Training the DSPAM tool to more effectively filter and quarantine suspected spam messages is not difficult.

Each time you receive an email message that you consider junk mail (spam), just drag or move it to a folder entitled DSPAM_spam.

DSPAM learns to identify future spam messages by comparing them with the messages it has successfully filtered in the past, as well as the messages you have identified as junk mail in the DSPAM_spam folder.

**Step 1:** Create a mail folder named DSPAM_spam

**Step 2:** Drag junk mail messages to the DSPAM_spam folder.
